One thing to add to the answers above - as bananas ripen, the starch in the flesh is converted into sugar. This continues until the starch that was providing the firmness and structure for the banana has, for the most part, been converted to sugar, which is also partly why the insides continue to get mushier as the banana ripens.

Banana plants are large, herbaceous perennials that produce pseudostems from underground rhizomes. Pseudostems are fleshy, upright stalks that serve as the functional trunks for the plants. Each pseudostem produces only one banana cluster before dying; however, new stalks are continuously produced from the rhizome to take their place.
