The manager had previously hung the flag 3.0 meters from the pivot point, and the bolt is 10 centimeters from the pivot point. To get rotational equilibrium, you need to have zero net torque: where net torque is represented by the Greek letter tau. In other words, if the torque due to the flag is τ_1 and the torque due to the bolt is τ_2

How to Calculate Rotational Equilibrium - dummies

An object is in rotational equilibrium if the velocity of its rotation is constant. An object that is not rotating or an object that is rotating in one direction a constant rate would be considered in rotational equilibrium. To be in rotational equilibrium, the net torque acting on the object must be zero.

Introductory Rotational Equilibrium Problem

Rotational equilibrium is defined as the state of a system for which the total angular acceleration is zero. Since it is the torque which is responsible for this 2 acceleration, a total torque of zero is also required for a system to be in rotational equilibrium.

PhysicsLAB: Rotational Equilibrium. Rotational Equilibrium. For a rigid body to be in a complete state of equilibrium it must first be in a state of translational equilibrium where the sum of all of the forces equals zero. Then, we must also place it in a state of rotational equilibrium where the sum of all of the torques equals zero.
