UN declares Africa free of polio - digitaljournal.com

Poliomyelitis is a viral disease that can affect nerves and can lead to partial or full paralysis. It is caused by infection with the poliovirus which can be spread by direct person-to-person contact, by contact with infected mucus or phlegm from the nose or mouth, or by contact with infected feces.

Poliomyelitis | Genetic and Rare Diseases Information ...

When this journal last published a special supplement on polio nearly 18 years ago, we lived in a world that was still deeply entangled with this devastating virus [1]. All 3 poliovirus serotypes were still circulating on four continents. Some of the world's largest countries remained mired in the disease, some with thousands of cases each year.

World Without Polio | The Journal of Infectious Diseases ...

To determine the prevalence of vaccine-associated paralytic poliomyelitis (VAPP) in immunodeficient infants, we reviewed all documented cases caused by immunodeficiency-associated vaccine-derived polioviruses in Iran from 1995 through 2008. Changing to an inactivated polio vaccine vaccination schedule and introduction of screening of neonates for immunodeficiencies could reduce the risk for ...

Vaccine-associated Paralytic Poliomyelitis In ...

Polio, short for poliomyelitis, is an infectious disease caused by the poliovirus. In about 0.5 percent of cases, there is muscle weakness resulting in an inability to move. This can occur over a few hours to a few days. The weakness most often involves the legs, but may less commonly involve the muscles of the head, neck and diaphragm.

Polio - Wikipedia

Widespread use of oral poliovirus vaccine has led to an ≈99.9% decrease in global incidence of poliomyelitis (from ≈350,000 cases in 1988 to 74 cases in 2015) and eradication of wild-type poliovirus serotypes 2 and 3. However, patients with primary immunodeficiency might shed vaccine-derived polioviruses (VDPVs) for an extended period, which could pose a major threat to polio eradication ...

Figure - Emerging Infectious Diseases Journal

Enteroviruses can shed in feces for several weeks, so many excrete viruses can remain infectious for a long time in environment. Therefore, by detecting enteroviruses in environmental specimens and sewage, we can understand this virus circulation, the approximate ratio of contaminated persons in society and they are suitable indicators for environmental surveillance. Since March 2006 to ...

Environmental surveillance of non-polio ... - Virology Journal

The last case of polio from India was reported in 2011. That year, the non-polio acute flaccid paralysis (NPAPF) rate in India was 13.35/100,000, where the expected rate is 1~2/100,000. A previous study of data from 2000 to 2010 has detailed the NPAPF rate in a state correlated with the pulse polio ...

(PDF) Poliomyelitis - ResearchGate

Author summary Oral polio vaccine (OPV) has played an essential role in the elimination of wild poliovirus (WPV). OPV contains attenuated (weakened) yet transmissible viruses that can spread from person to person. In its attenuated form, this spread is beneficial as it generates population immunity. However, the attenuation of OPV is unstable and it can, in rare instances, revert to a virulent ...
